Miyawaki’s Method

Have them adapted to natural environmental conditions in the existing forests. (for one week to one month)

Plant seedlings into plant-site. Maintenance is necessary for on or three years. After that, nature will foster the planted seedlings. (No management is best management.)

Collecting seeds and seedlings (just after germination) from natural forest.

Germinate seeds in the propagation bed. Transplant them into the pots at the stage of budding 2 to 3 leaves. Nurturing them under the roof (full shade).

Nurturing one or two months under 30-40% shade-rate.

Transfer to seedling bed under the shade-roof of 60% shade-rate. (nurturing one or two months)

Nurturing one or two months more under 30-40% shade-rate.
